

## COMMERCIAL

No matter how big or small your project is, the Acoustics team at Create Consulting Engineers has a huge amount of practical experience in undertaking noise impact assessments, internal acoustic design specification and workplace noise assessments for various commercial clients, to help your project.

We have worked on repeated projects at numerous locations with major international clients, such as McDonald's, Getir and Ben Burgess, as well as smaller businesses across the UK.

Whether you are looking to meet the requirements of your planning application/building regulation conditions or even if you are looking to create an excellent space for your customers/staff we can advise on what is needed to make the most out of the project.

Our team is also experienced in the detailed acoustic design for offices, retail and shopping centres, community centres, business centres and have been heavily involved in the development of the Broadland Business Park over the years of its development.

The importance of a good acoustic design is paramount to creating a comfortable and inclusive environment and early-stage input is usually underrated when integrating the acoustic design with other design disciplines.

As our Acoustics team is part of a wider multidisciplinary company, we understand the need to communicate effectively between disciplines to bring a project to completion within budget and whether we are working with our in-house team or integrating with other consultancies in the design team, we strive for clear, concise and timely communication throughout our involvement on the project.
